Notes & Resources	17

SUMMARY

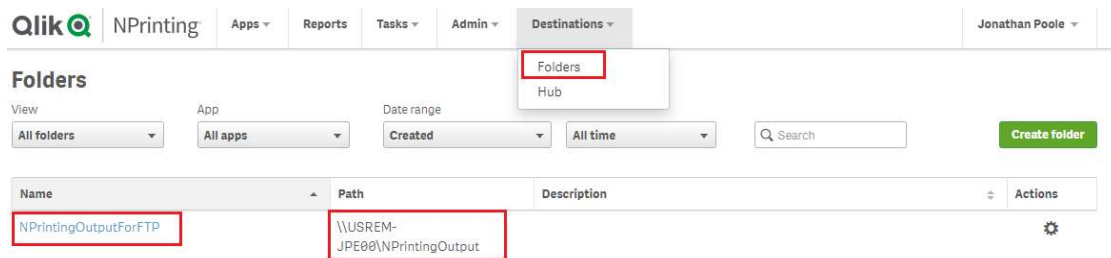

- NPrinting 17+ supports the ability to distribute reports to folders.
- The “Qlik FTP/SFTP Web Connector” can upload file(s) over FTP from a hard drive folder to an FTP server.
- The FTP parameters can be submitted dynamically based on data driven expressions
- Like all connectors, the FTP/SFTP Connector is activated through the Qlik load script.
- An NPrinting publish task can also be activated through the Qlik load script using the Qlik REST Connector allowing reports to be written to the hard drive and subsequently uploaded over FTP from the same load script...
- This offers a potential replacement solution for a product feature that was available in NPrinting v16 but was not included in NPrinting v17+

Configure an NPrinting Publish Task to distribute reports to folders

An NPrinting task can be configured to generate report(s) and write them to an accessible hard drive location.

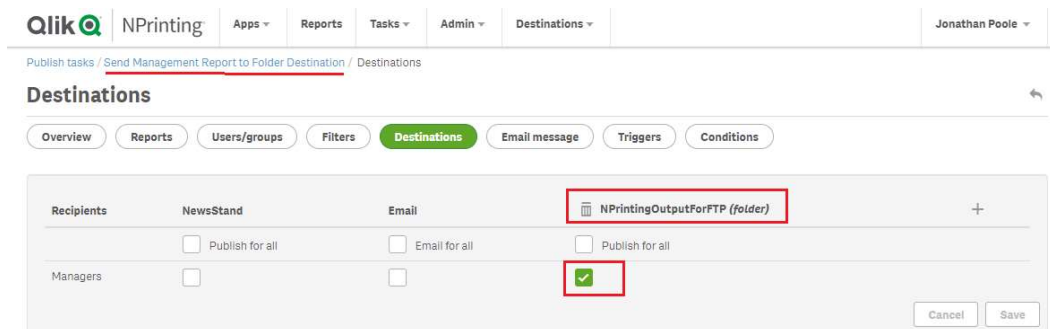

The following steps assume prior configuration of an NPrinting Publish Task that successfully distributes a simple report to a single recipient.

- Configure a destination folder in the NPrinting Web Console where the service account that runs the NPrinting services has WRITE access to the windows “Path” in the destination. UNC paths are acceptable.

Next, configure the “Publish Task” to distribute the report(s) to the same destination

- Note the Publish Task Name in this sample is “**Send Management Report to Folder Destination**”. You can change the name but make a note of it as we will need to use the name later.

For ease of troubleshooting, enable the NPrinting report that is used by the Publish Task to have dynamic naming and include both the date and time in the report output file name

Publish task

Name Send Management Report to Folder Destination

From Admin->Task Executions monitor the status and verifies it completes successfully.

Queued:

The screenshot shows the Qlik NPrinting Admin console. The 'Admin' menu is open, and 'Task executions' is highlighted. The main area displays 'Task executions' with filters for 'View' (All executions), 'Task type' (All types), and 'Date range' (Created). A table lists one task: 'Send Management Report to Folder Destination' with a status of 'Queued' and 0% progress.

Task name	Task type	Status	Progress	Created
Send Management Report to Folder Destination	Publish report	Queued	0%	September 19, 2019 12:27 PM

Completed

The screenshot shows the Qlik NPrinting Admin console with the 'Task executions' page. The filters are the same as in the previous screenshot. The table now shows the task 'Send Management Report to Folder Destination' with a status of 'Completed' and 100% progress.

Task name	Task type	Status	Progress	Created	Last updated
Send Management Report to Folder Destination	Publish report	Completed	100%	September 19, 2019 12:27 PM	September 19, 2019 12:27 PM

Check the destination folder and confirm the Report Name has been successfully written

📁 > Network > usrem-jpe00 > NPrintingOutput

Name	Date modified	Type	Size	Folder
Sales Report2019-09-1912-27-1...	9/19/2019 12:27 PM	PDF File	34 KB	NPrintingOutput (\\usrem-jpe00)

You are now ready to trigger the same publish task from a Qlik load script!

Triggering an NPrinting Publish Task from Qlik load script

It is possible to trigger NPrinting Publish Tasks via the Qlik REST Connector directly from a QlikView or Qlik Sense load script using fully supported Qlik scripting methods and fully supported Qlik products.

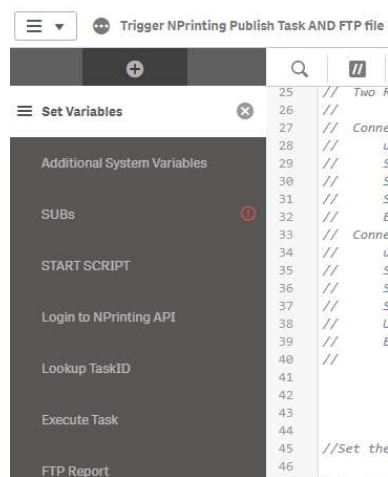

Prior to authoring the script, you must first successfully configure two REST Connections to the NPrinting Server. One REST Connection for GET requests (reading information from the NPrinting API) and a 2nd REST Connection for POST (and related write) requests. The steps to author these REST Connections are variable in this reference document [How to use Qlik NPrinting APIs inside a Qlik Sense load script](#).

Upon successfully configuring and testing the two NPrinting REST Connections you are now ready to write Qlik load script to login to NPrinting and trigger an NPrinting Task execution

There are many ways of writing Qlik load script and the following sample is just one way that attempts to follow best practices through use of functions and variables.

Sample Setup

- Import the app “<Name>” into your Qlik Sense site
- Open the App from the Qlik Sense Hub and proceed to the Data Load Editor.

```
Trigger NPrinting Publish Task AND FTP file
25 // Two R
26 //
27 // Conne
28 // u
29 // S
30 // S
31 // S
32 // E
33 // Conne
34 // u
35 // S
36 // S
37 // S
38 // U
39 // E
40 //
41
42
43
44
45 //Set the
46
```

- Select the “Set Variables” section
- Change the names of both the NPrinting Connections (“NPrintingAPIGET” and “NPrintingAPIPOST”) to the names of your two REST connections.

Tip! You can remove the USERID suffix of a connection by editing the connection name in the QMC

```
47 let vAPIConnectionNameForGET = 'NPrintingAPIGET';
48 let vAPIConnectionNameForPOST = 'NPrintingAPIPOST';
```

- Change the names of the NPrinting Server host and port as well as the Qlik Sense Server host and port. It is ok to put the QlikView Server name for the value vQlikSenseServer.

```
50 //Set these 2 variables to determine the prefix of your NPrinting API endpoint
51
52 let vSSL='True'; // True or False
53 let vNPrintingServer='USREM-JPE00.QLIKTECH.COM:4993';
54 let vQlikSenseServer='USREM-JPE00.QLIKTECH.COM';
```

Using the two REST Connections, it is possible to trigger the execution of an NPrinting Publish task via supported API endpoints.

- Change the name of the NPrinting Publish Task ‘Send Management Report to Folder Destination’ to be the name of the Publish Task that you are testing with

```
57 // NPrinting publish task to trigger
58 let vNPrintingPublishTaskName = 'Send Management Report to Folder Destination';
```

By triggering an NPrinting Publish Task execution from a Qlik Sense load script you should take care to track and manage how the NPrinting Publish Tasks finishes. If the NPrinting Publish Task fails, then its recommended that the Qlik reload execution be configured to error out so an administrator can track failures in the NPrinting Report generation directly from the QMC.

The sample thus provides two variables to define how long the NPrinting Task will be allowed to complete.

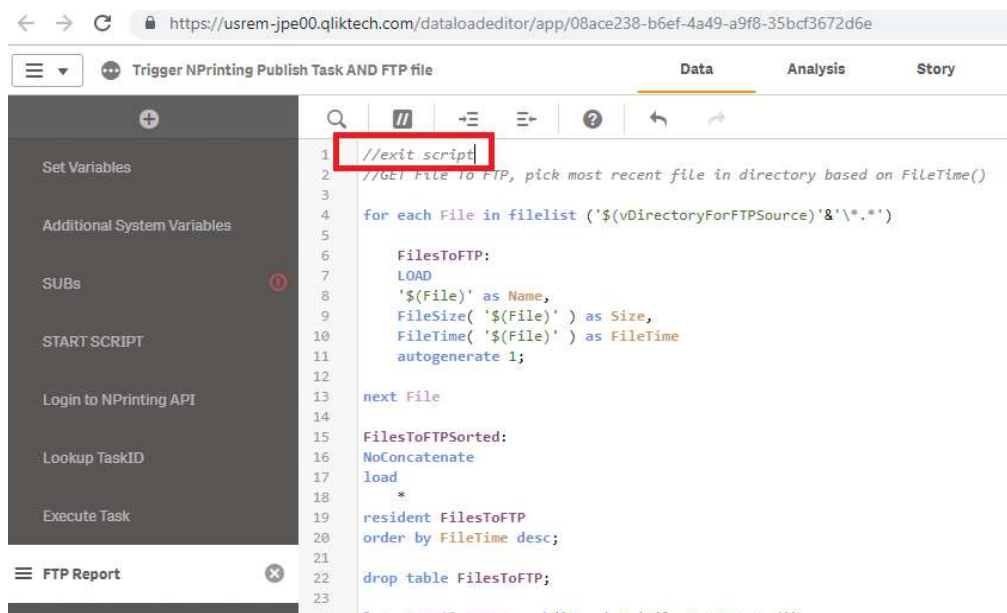

- Optionally change “vTaskTimeoutMinutes” to the desired timeout interval (in minutes)

- Optionally change “vTimeoutCheckIntervalSeconds” to the desired interval at which the load script check for the status of the NPrinting Publish Task Execution (in seconds)

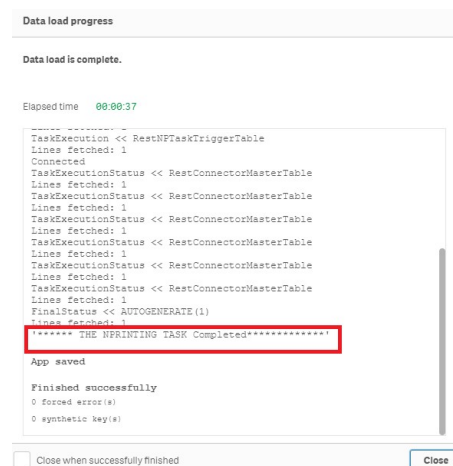

```
// NPrinting publish task to trigger
let vNPrintingPublishTaskName      ='Send Management Report to Folder Destination';
let vTaskTimeoutMinutes = 60 ; // timeout in Minutes
let vTimeoutCheckIntervalSeconds = 5 ; // timeout check in seconds
```

That’s it for NPrinting Publish Task configuration. To test this section out, go to the “FTP Report”

Section and comment out the //exit script line so that script doesn’t attempt to FTP. That steps comes later.

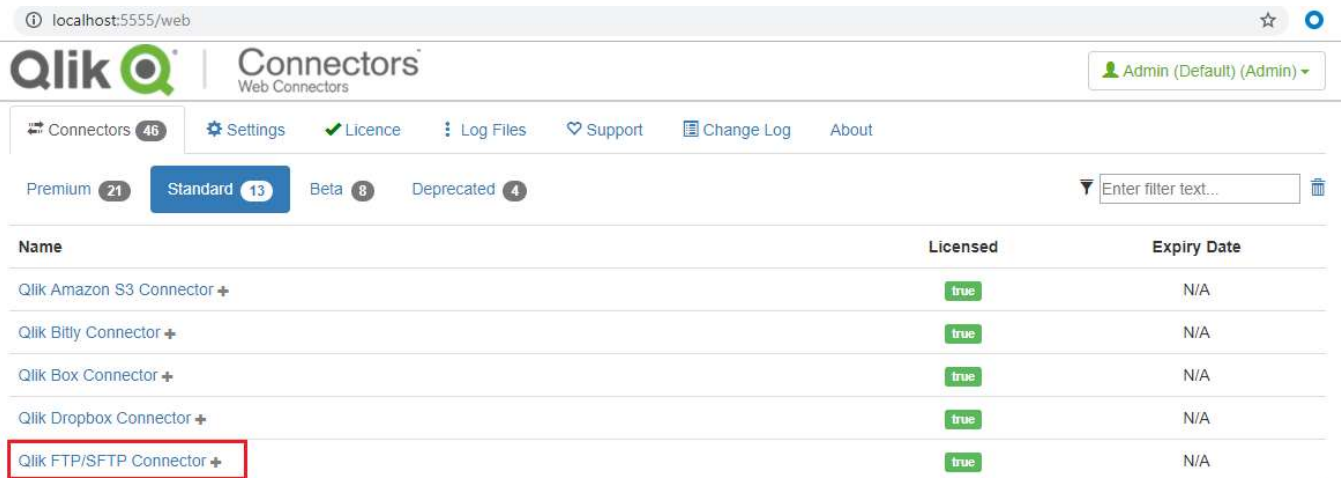

Upon successful completion of the NPrinting Publish Task Execution, the script is configured to log additional LOG statements using the TRACE statement.

The Qlik FTP/SFTP Web Connector

The Qlik FTP/SFTP Web Connector can be added to the Qlik Server by installing, configuring, starting and licensing the Qlik Web Connector package. To install , configure, start and license the web connectors please refer to the online help [Here](#)

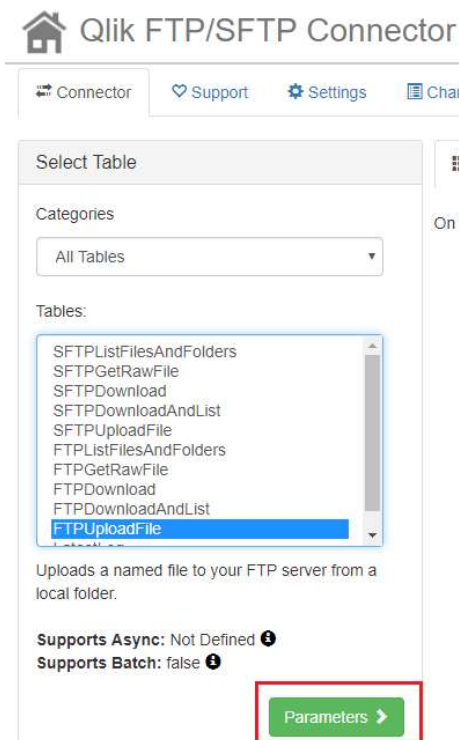

- Open the Qlik Web Connectors console

The screenshot shows the Qlik Connectors Web Connectors console. The page title is "Connectors Web Connectors" and the user is "Admin (Default) (Admin)". The navigation menu includes "Connectors 46", "Settings", "Licence", "Log Files", "Support", "Change Log", and "About". Below the navigation, there are filters for "Premium 21", "Standard 13", "Beta 8", and "Deprecated 4". A search bar contains "Enter filter text...". The main content is a table of connectors:

Name	Licensed	Expiry Date
Qlik Amazon S3 Connector +	true	N/A
Qlik Bitly Connector +	true	N/A
Qlik Box Connector +	true	N/A
Qlik Dropbox Connector +	true	N/A
Qlik FTP/SFTP Connector +	true	N/A

- Under "Tables", select "FTPUploadFile" and click "Parameters"

The screenshot shows the Qlik FTP/SFTP Connector configuration page. The page title is "Qlik FTP/SFTP Connector". The navigation menu includes "Connector", "Support", "Settings", and "Char". The "Select Table" section has a "Categories" dropdown set to "All Tables". The "Tables:" section contains a list of tables, with "FTPUploadFile" selected. Below the list, there is a description: "Uploads a named file to your FTP server from a local folder." and two status indicators: "Supports Async: Not Defined" and "Supports Batch: false". The "Parameters" button is highlighted with a red box.

- Enter the HOST, Port, User Name, and Password that corresponds to your FTP environment.

Uploads a named file to your FTP server from a local folder.

Host *

FTP Mode (Default=Ftp)

Port

User Name

Password ⓘ

Ignore Proxy ⓘ

Source File (e.g. c:\Qlik Web Connectors\Temp\MyData.txt) * ⓘ

Remote Path (e.g. /myFolder/My File.txt) * ⓘ

- For testing purposes, I suggest manually placing ANY file in the “NPrintingOutput” windows folder and ensure the file access privileges are such that the service account running the Qlik Web Connectors Service and Qlik Sense Engine service can read the file. Use the file’s filename in the “Source File” and “Upload Path”

- Click “Save Inputs & Run Table”

Uploads a named file to your FTP server from a local folder.

Triggering an FTP from Qlik load script

The upload test above will provide you with sample Qlik Load script

- In the same Web Connectors session, click on the “Qlik Sense Standard Mode” (For QlikView, click the appropriate tab.

[Data Preview](#)
[New! Qlik Sense \(Standard Mode\)](#)
[Qlik Sense \(Legacy Mode\)](#)
[QlikView](#)

NOTE: Previously, Qlik Sense had to be put in 'legacy mode' when used with the Qlik Web Connectors. A change was made in the Qlik Sense February '18 release, to remove this requirement and Qlik Web Connectors September '18 release has been updated accordingly. Following the instructions below, you can use the script on this tab without putting Qlik Sense into Legacy mode.

IMPORTANT: This will only work if the Qlik Sense reload process is running from one of the following 'white listed' IP addresses:

- localhost

You can add or remove addresses from this list from 'Start Page' -> 'Settings' -> 'My Settings' -> 'Allowed IP Addresses'.

Within Qlik Sense you need to go to the 'Create new connection' -> 'Web file' dialog, using URL: 'http://usrem-jpe00:5555' and give it a name. You should then ensure that you place the following line at the top of your script and replace YOUR_CONNECTION_NAME with the name of the connection that you have created.

```
let vQwcConnectionName = 'lib://YOUR_CONNECTION_NAME';
```

[Read more about this here.](#)

Copy the following load script into your Qlik Sense application.

```
FileTransferConnector_FTPUploadFile:
LOAD
    Status as FTPUploadFile_Status
FROM [$(vQwcConnectionName)]
(URL IS [http://usrem-jpe00:5555/data?
connectorID=FileTransferConnector&stable=FTPUploadFile&host=localhost&ftpMode=Ftp&port=21&userName=user1&pass=
54-06.pptx&remotePath=%2FUpload%2FSales+Report12-54-06.pptx&appID=], qvx);

// IMPORTANT: If, when loading the above script, you receive a 'Script Error' Dialog box
with a 'Field Not Found'
// (or other) error, the first thing you should do is copy and paste the full request URL
(i.e. the URL between the square [...])
// brackets IN THE QLIKVIEW / QLIK SENSE SCRIPT ERROR DIALOG) into a browser address bar and
check the response.
```

[Copy to clipboard](#)

- Follow the instructions on the page to create a QWC Data Connection in the Qlik load script

Within Qlik Sense you need to go to the 'Create new connection' -> 'Web file' dialog, using URL: 'http://usrem-jpe00:5555' and give it a name. You should then ensure that you place the following line at the top of your script and replace YOUR_CONNECTION_NAME with the name of the connection that you have created.

```
let vQwcConnectionName = 'lib://YOUR_CONNECTION_NAME';
```

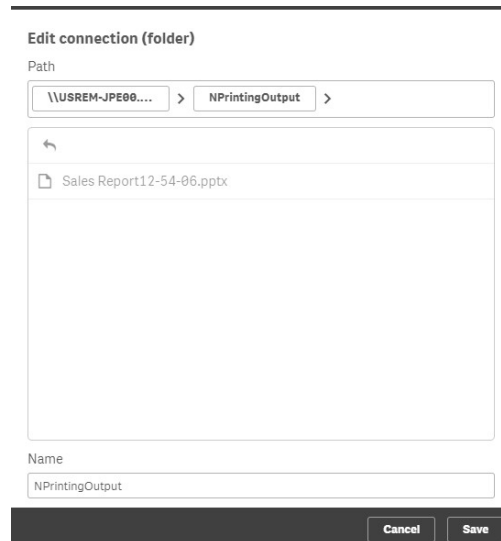

- Move the "let vQwcConectionName" statement to the "Set Parameters" section of the sample as highlighted below. At the same time, update the FTP host, port, and the Qlik Web Connectors Server name in the highlighted lines as well.

The screenshot shows the Qlik Sense script editor interface. The left sidebar contains a 'Set Variables' panel with a search bar and a list of variables including 'Additional System Variables', 'SUBs', 'START SCRIPT', 'Login to NPrinting API', 'Lookup TaskID', 'Execute Task', and 'FTP Report'. The main editor area displays a load script with line numbers 38 to 67. Several lines are highlighted with red boxes:

- Line 55: `let vQlikWebConnectorsServer='USREM-JPE00.QLIKTECH.COM:5555';`
- Lines 62-67: `// FTP Server settings`
`let vFTPServer='localhost';`
`let vFTPServerPort='21';`
`let vQwcConnectionName = 'lib://QWC';`

The script also includes comments for NPrinting settings and API endpoints.

- Next, create a new Folder Data Connection that points to the same directory that the NPrinting Publish Task writes its reports too. In the sample it points to “\\<YourServer>\NPrintingOutput” and is named “NPrintingOutput”

- On the “Set Parameters” section, add the name of the same folder data connection

```
// FTP Server settings
let vFTPServer='localhost';
let vFTPServerPort='21';
let vQwcConnectionName = 'lib://QWC';
let vDirectoryForFTPSource='lib://NPrintingOutput';
```

- Return to the Web Connectors console.
- Copy the test between the () characters that follows the “URL IS” prefix in the section highlighted below. Paste it into the “FTP Report” section of the load script. We will only be using portions of the URL.

```
Copy the following load script into your Qlik Sense application.
FileTransferConnector_FTPUploadFile:
LOAD
    Status as FTPUploadFile_Status
FROM $(vQwcConnectionName)
(URL IS [http://usrem-jpe00:8555/data?
connectorID=FileTransferConnector&table=FTPUploadFile&host=localhost&ftpMode=Ftp&port=21&userName=user1&password=NFfct2fRWEYKGF1JG3
54-06.pptx&remotePath=t2fUpload&2fSales+Report12-54-06.pptx&appID=], qwk);
```

- In the “FTP Report” section of the load script, find the following LET statement for vFTPString.

```
let vFTPString=
'[http://' & '$(vQlikWebConnectorsServer)' & '/data?connectorID=FileTransferConnector&table=FTPUploadFile
&host=' & '$(vFTPServer)' &
&ftpMode=Ftp' &
&port=' & '$(vFTPServerPort)' &
&userName=user1&password=5HKYVqqyDCqhfECvOPH6pg%3d%3d%3akifaQk6RIMIGktgnsOijbA%3d%3d&ignoreProxy=False'
&sourceFile=c%3a%5cNPrintingOutput%5c' & '$(vFileToFTP)' &
&remotePath=%2fUpload%2f' & '$(vFileToFTP)' &
&appID=]'
;
```

- Replace the highlighted strings with the corresponding sections from the copied URL from the Qlik Web Connectors console

```
let vFTPString=
'[http://' & '$(vQlikWebConnectorsServer)' & '/data?connectorID=FileTransferConnector&table=FTPUploadFile
&host=' & '$(vFTPServer)' &
&ftpMode=Ftp' &
&port=' & '$(vFTPServerPort)' &
&userName=user1&password=5HKYVqqyDCqhfECvOPH6pg%3d%3d%3akifaQk6RIMIGktgnsOijbA%3d%3d&ignoreProxy=False'
&sourceFile=c%3a%5cNPrintingOutput%5c' & '$(vFileToFTP)' &
&remotePath=%2fUpload%2f' & '$(vFileToFTP)' &
&appID=1'
;
```

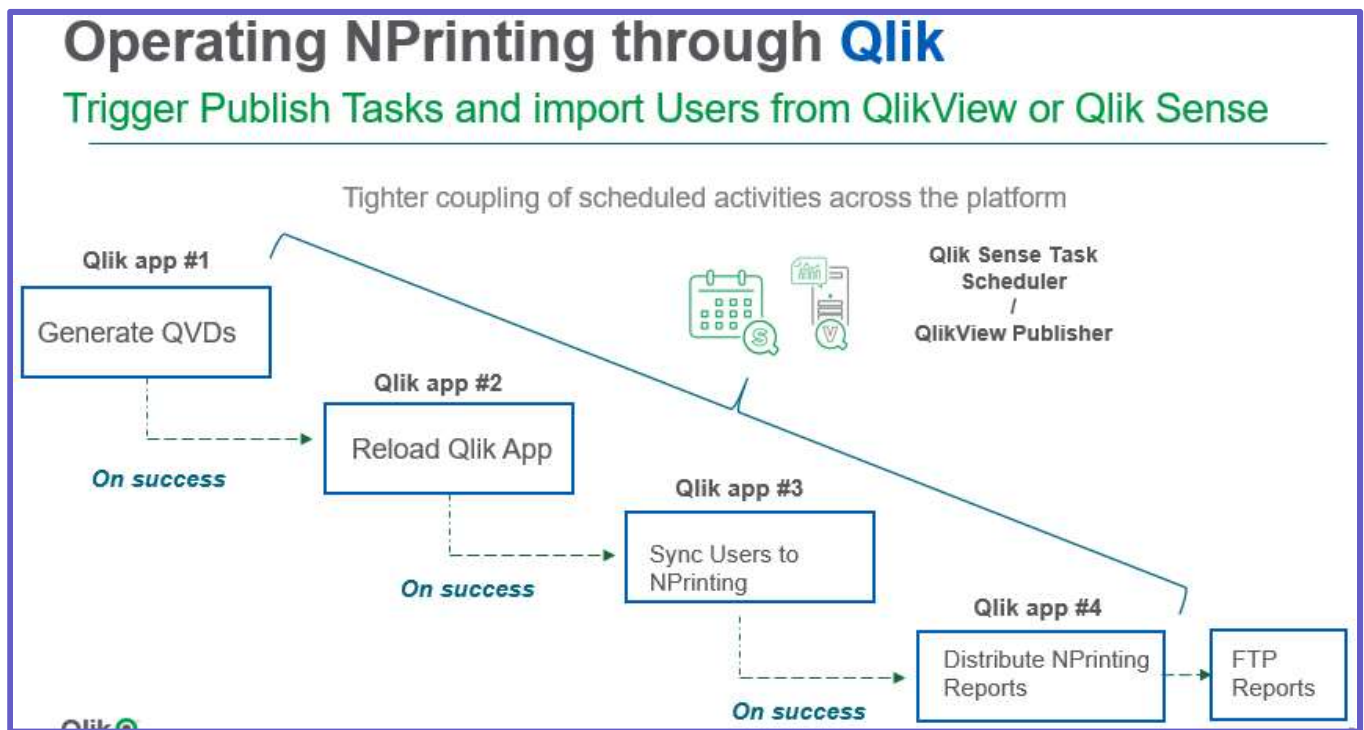

- Note that the ‘sourcFile’ parameter uses a variable “vFileToFTP” to provide the encoded file name of the file to FTP. In this sample, the file that is uploaded over FTP is the most recent file found in the FTP directory. The Qlik load script loads a listing of each file and the modification time using the FileTime() function .It sorts the filenames by FileTime in descending order and chooses the first file to FTP.

```
1 //GET File To FTP, pick most recent file in directory based on FileTime()
2
3 for each File in filelist ('$(vDirectoryForFTPSource)'\*.*)
4
5     FilesToFTP:
6     LOAD
7     '$(File)' as Name,
8     FileSize( '$(File)' ) as Size,
9     FileTime( '$(File)' ) as FileTime
10    autogenerate 1;
11
12 next File
13
14 FilesToFTPSorted:
15 NoConcatenate
16 load
17 *
18 resident FilesToFTP
19 order by FileTime desc;
20
21 drop table FilesToFTP;
22
23 let vLIBFileToFTP=peek('Name',0,'FilesToFTPSorted');
24 let vFileToFTP=mid( '$(vLIBFileToFTP)', len('$(vDirectoryForFTPSource)')+2 ) ;
25 // The Web Connectors need to encode the URL.
26 // This supports standard numbers and letters and spaces. Other characters in the file name have not been tested
27 let vFileToFTP=replace( '$(vFileToFTP)', ' ','+');
28
```

Now reload the Qlik app and you can monitor the NPrinting Publish Task, Qlik Load Script, and FTP to ensure completion.

Expanding the Chain

When you are ready, you can chain the Qlik app with other upstream reload tasks like QVD generation , Qlik Dashboard reloading, and NPrinting User Imports and Syncs.
